						Representativity	Relative Surface	Conservation	Global
6240 			9.1		G	B	C	A	B
6510 			3.0		G	C	C	A	B

- **PF:** for the habitat types that can have a non-priority as well as a priority form (6210, 7130, 9430) enter "X" in the column PF to indicate the priority form.
- **NP:** in case that a habitat type no longer exists in the site enter: x (optional)
- **Cover:** decimal values can be entered
- **Caves:** for habitat types 8310, 8330 (caves) enter the number of caves if estimated surface is not available.
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation)

3.2 Species referred to in Article 4 of Directive 2009/147/EC and listed in Annex II of Directive 92/43/EEC and site evaluation for them

- **NP:** in case that a species is no longer present in the site enter: x (optional)
- **Type:** p = permanent, r = reproducing, c = concentration, w = wintering (for plant and non-migratory species use permanent)
- **Unit:** i = individuals, p = pairs or other units according to the Standard list of population units and codes in accordance with Article 12 and 17 reporting (see [reference portal](#))
- **Abundance categories (Cat.):** C = common, R = rare, V = very rare, P = present - to fill if data are deficient (DD) or in addition to population size information
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation); VP = 'Very poor' (use this category only, if not even a rough estimation of the population size can be made, in this case the fields for population size can remain empty, but the field "Abundance categories" has to be filled in)

4. SITE DESCRIPTION

4.1 General site character

[Back to top](#)

Habitat class	% Cover
N14	25.0
N09	75.0
Total Habitat Cover	100

Other Site Characteristics

Am Ostrand der Parndorfer Platte eine Geländekante, die steil zur Leithaniederung abfällt. Quarzreiche pannone Sande und Schotter führten zur Entstehung stark saurer Böden. Die Grobkörnigkeit der Sedimente, sowie die austrocknende Wirkung des Windes, verbunden mit einer nur schwach ausgebildeten Humusschicht im Hangbereich führten zur Ausbildung einer artenreichen Trockenrasen Gesellschaft. Im Bereich des Hangfußes schließen Mähwiesen an.

4.2 Quality and importance

Der Artenreichtum des Silikattrockenrasens macht diesen Standort zu einem wichtigen Element der pannonischen Lebensräume. In Folge der Flachgründigkeit und der Steilheit der Trockenrasen sind diese trotz über Jahre fehlender Beweidung in einem repräsentativen Zustand erhalten geblieben.
